

Kansas Multi-Tier System of Supports & Alignment

Preschool Early Numeracy Guide

2022-2023
Academic Year

Introduction to Document

The *Kansas Multi-Tier System of Supports & Alignment Guides* have been created to assist teams in documenting the structures necessary to begin the implementation of a Kansas Multi-Tier System of Supports (MTSS). This document might contain tools that are to be used in conjunction with content area-specific documents for reading, mathematics, behavior, and social-emotional content areas. All Kansas MTSS and Alignment documents are aligned with the *Kansas Multi-Tier System of Supports: Innovation Configuration Matrix (ICM)*, which describes the critical components of an MTSS, the features of a fully implemented MTSS, and the *Kansas Multi-Tier System of Supports: Research Base*, which provides a basic overview of the research support for the MTSS.

Acknowledgments

A significant investment of time and energy from numerous Kansas educators and their districts, organizations, and partners made this document possible. This document reflects their efforts to learn and help others understand what it takes to make MTSS a reality within schools. This grassroots effort on the part of Kansas educators indicates a commitment to meeting the needs of every student and sharing wisdom from the field and the research. As the list of individuals and districts that have contributed to this effort over the past years has become too long to detail, a collective expression of gratitude is offered here to everyone who has contributed to the concepts, ideas, and knowledge that are reflected in all Kansas MTSS and Alignment documents.

The contents of this resource were developed under an agreement from the Federal Department of Education to the Kansas State Department of Education. However, the contents do not necessarily represent the policy of the Department of Education, and endorsement by the Kansas State Department of Education or the Federal Government should not be assumed. Kansas MTSS and Alignment is funded through Part B funds administered by the Kansas State Department of Education's Special Education and Title Services. Keystone Learning Services does not discriminate on the basis of race, color, national origin, sex, disability, or age in this program and activities. The following person has been designated to handle inquiries regarding the non-discrimination policies: Keystone Learning Services Executive Director, 500 E. Sunflower Blvd, Ozawkie, KS 66070, 785-876-2214. Authorization to reproduce in whole or in part is granted. Permission to reprint this publication is not necessary.

After spending time with intentional planning and building the structures of your Multi-Tiered System of Supports and Alignment (MTSS), your preschool program is ready to implement the plans you have put in place. For an MTSS structure to function at an optimal level, system-level supports continue to be necessary during the implementation phase of your plan. This guide is intended to provide assistance regarding the implementation of a preschool mathematics MTSS; however, it is critical for teams to develop an ongoing process for reflection and revision of their MTSS structures to ensure that their MTSS is sustainable over time and not dependent on any single person working within the system.

As you will remember, the Kansas MTSS and Alignment is graphically represented by three arcs around the outside of a triangle. Each element represents a foundational concept that supports all of the work within the system.

Leadership: Strong and functioning leadership across the *Self-Correcting Feedback Loop* ensures information consistency, refined decision making, fidelity of implementation, and the support of stakeholders.

Professional Development: Supporting ongoing professional development within the Kansas MTSS and Alignment requires a carefully designed and executed plan. Comprehensive professional development tied to your MTSS must be planned and monitored for fidelity to ensure that all staff members receive initial and ongoing training and support for selected assessments, curriculum, and interventions.

Empowering Culture: In a sustainable system, it is important that stakeholders be actively involved in the process of school improvement. Leadership teams must not only plan differentiated professional development opportunities for the entire staff, but also train collaborative teams to be effective problem solvers. Other stakeholders' active involvement should be encouraged and recognized in the decision-making process.

Curriculum: Curricular materials should be evidence-based and align with the *Kansas Early Learning Standards*. The particular curriculum you use is not as important as ensuring that all essential mathematic components are addressed, materials are readily available, and staff members are trained and actually use the curriculum with fidelity.

Instruction: An evidence-based instructional design ensures that instruction is developmentally appropriate, explicit when necessary, differentiated, systematic, and scaffolded.

Assessment: In a multi-tiered system, a comprehensive assessment system allows staff members to make essential instructional decisions based on valid and reliable data. In preschool, multiple assessments are used for a variety of purposes, which can lead to misunderstanding and misinterpretation. It is important that those administering and interpreting assessments have a good understanding of the purposes and uses of each assessment.

Introduction

In Kansas, there is a belief that all children can learn. Fundamentally, every student should be challenged to achieve high standards, both academically and behaviorally. An aligned, systemic framework for ensuring that all students have this experience is referred to as the Kansas Multi-Tier System of Supports and Alignment (MTSS). Simply put, the Kansas MTSS and Alignment is a set of evidence-based practices implemented across a system to meet the needs of all learners. The Kansas MTSS and Alignment builds a system of prevention, early intervention, and support to ensure that all children learn. Additionally, the Kansas MTSS and Alignment establishes a system that intentionally focuses on leadership, professional development, and an empowering culture in addition to a focus on student learning.

The Kansas MTSS and Alignment incorporates a continuum of assessment, curriculum, and instruction. This systemic approach supports both struggling and advanced learners through the selection and implementation of increasingly intense, evidence-based interventions in response to both academic and behavioral needs. The Kansas MTSS and Alignment system establishes a Self-Correcting Feedback Loop that includes ongoing monitoring of the effectiveness of instruction to ensure that each Kansas student achieves high standards.

Across the nation, schools use a variety of curricula, interventions, and methods to monitor student learning, both academically and socially. The goal of Kansas MTSS and Alignment is to provide a systemic approach to meet the needs of all students. To achieve this, resources must be used in a manner that is both effective and efficient. While the Kansas MTSS and Alignment does not necessarily require additional resources or additions to the existing practices, it does involve evaluating the current practices to identify those that yield evidence of effectiveness, address areas that are missing, and replace ineffective or inefficient approaches with those that are supported by research evidence. The Kansas MTSS and Alignment is an approach to school improvement and accreditation activities that addresses the academic and behavioral achievement of all students.

Math and Preschool MTSS

Long before young children enter school, they naturally and spontaneously explore and use mathematics. Starting in infancy, babies are curious about their world and begin to think about it in mathematical ways. As early as 10 months of age, infants can distinguish a set of two items from a set of three. Unfortunately, mathematics has often taken a back seat to literacy, both in homes and in classrooms. When parents are asked which is more important, they more frequently say language and literacy over mathematics. They value early language and literacy skills because they are reflective of how children communicate and express themselves. Teachers of young children also tend to neglect teaching mathematics due to their own negative experiences with math (NRC 2009; Clements & Sarama, 2009; Copley 2010).

Nevertheless, learning mathematics is vital for young children's school success. Not only does early mathematical competence influence children's future success in mathematics, it can also impact success in literacy, science, and technology. Early mathematic competence is actually one of the best predictors of school success across the curriculum (Duncan et al., 2007;

NAEYC/NCTM, 2010).

Children’s learning of mathematics is improved when children are provided research-based teaching and learning strategies, well-planned and sequenced curriculum, and integrated mathematical experiences (i.e., teaching mathematics through meaningful contexts). Young children need opportunities to practice and extend mathematical thinking through play, exploration, and creative thinking (NRC, 2009), which makes the application of the Kansas MTSS and Alignment for mathematics in preschool especially important.

The National Research Council (NRC) Committee on Early Childhood Mathematics along with the National Council of Teachers of Mathematics (NCTM) recommends that preschool mathematics instruction concentrates on three areas, also known as focal points: numbers and operations (i.e., numbers, comparison, counting, and cardinality), geometry (i.e., shapes and spatial relationships), and measurement (i.e., identifying measurable attributes and comparisons based on those attributes). NRC and NCTM also recommend prioritizing instructional time for each of these areas. The primary focus of mathematics instructional time in preschool should be on numbers and operations. The second priority should be geometry, but with less time devoted to it than numbers and operation. Thirdly, NRC and NCTM recommend only a small amount of instructional time be set aside for measurement. In addition, they recommend that the work on patterning and data be woven into the main three focal areas and not taught using the same time investment as the prioritized topics. It should be noted that, when lessons combine more than one of the topics (e.g., including numbers in a geometry lesson), it facilitates learning and deepens the understanding of both topics (NRC, 2009; Fusion et al., 2010). The Kansas MTSS and Alignment was designed to utilize these key areas and early mathematical research to support all learners.

There is a need for more intentional and explicit mathematics instruction in preschool classrooms. Teaching all students to be mathematically competent requires a system for the early identification of students who are at risk as well as a system for providing those students with the interventions they need to become proficient in mathematics. Good classroom curriculum and instruction can meet the needs of most students; however, an efficient system for providing high-quality interventions is required to ensure that the needs of all students are met.

At times, the application of the Kansas MTSS and Alignment in preschool will be slightly different from what might be put in place for school-aged children; however, the basic process and practices are similar. For appropriate application to occur, leadership teams must understand the similarities and differences between programming for very young children and those approaches used in more formal schooling. It is important that programs use evidence-based instructional practices that have been shown to be effective with young children, including developmentally appropriate teaching strategies.

Creating the Structure for a Preschool MTSS

The guidance for creating the necessary structure for a preschool MTSS and Alignment currently focuses on the following:

1. Implementation of an evidence-based core curriculum that supports the acquisition of early math skills and serves as the foundation for meeting the needs of ALL children.
2. Instructional strategies and interventions that support the acquisition of early math skills through differentiated instruction (e.g., small flexible groups, embedded learning opportunities).
3. Determination of preschool end-of-the-year learning targets based on information gathered from curriculum-based assessments, early math general screening tools, and/or other means (e.g., Kansas Early Learning Document: Early Learning Standards [KSELD]) as identified by your leadership team.
4. Universal screening and progress-monitoring activities that assess the areas of early math that are predictive for later math success, specifically those activities included in numbers and operations.
5. Identification of preschool children for whom the core curriculum and instruction does not appear to be sufficient and who might need more intensive instruction.
6. Provision of tiered support (Tier 2/3) through more targeted instruction on specific skills.

Tier 1/Curriculum and Instruction for Early Mathematics

From birth, young children develop knowledge and skills that build a foundation for later mathematical ability. These skills do not develop in isolation; they are intertwined with other developmental domains (Copple & Bredekamp, 2009). As young children explore their world, specific interests spark in-depth investigations, and playtime provides meaningful opportunities to practice and become proficient. Preschool teachers must intentionally create environments and utilize instructional strategies to build children's math competence and conceptual knowledge, while also promoting the capacity for reflection, explanation, and justification of thinking.

How preschool educators teach math is as important as what they teach young children. Early mathematics experts advocate for a balanced approach to preschool instruction (NRC, 2009; Fuson et al., 2010). Traditionally, math in preschool has focused on narrow skill-based instruction embedded within calendar and/or center time, which often results in haphazard or random instruction. When teachers do give mathematics adequate curricular time, they often try to cover so many topics that the results can be superficial and uninteresting to children.

Strong early mathematical programs provide a combination of teacher-directed and child-initiated activities, differentiation, grouping strategies (large, small, and individual), and flexible schedules that allow for sustained and in-depth learning through play and responsive/nurturing teaching techniques (Clements & Sarama, 2009; NAEYC/NCTM, 2010). Teachers should teach specific math lessons in a logical sequence to expand children's learning to a deeper level of understanding and to ensure that no skills are left to chance. That same logical sequence must also be incorporated through the indirect teaching that happens across the daily schedule.

It is important to understand that mathematics and mathematical thinking are distinct in nature. Mathematics is a means of mathematical thinking and reasoning. Mathematical proficiency is one of the greatest predictors of the future academic success of students (Duncan et al., 2007). The Standards for Mathematical Practice describe the variety of expertise that educators should seek to develop in young children. These practices are grounded in the important processes and

proficiencies shown to have longstanding importance for mathematics education. The list below presents the Standards of Mathematical Practice and ideas for their application in preschool classrooms.

Standards for Mathematical Practice (Common Core, 2012)

1. Make sense of problems and persevere in solving them

Students should be able to understand the problem, determine appropriate ways to attack it, and stick with it until the problem is solved. Preschool students begin to build the understanding that math involves solving problems and asking questions using concrete objects. They check their thinking by asking, “Does this make sense” and by trying a variety of strategies to solve a problem. Teachers can support this problem-solving process by asking questions such as, “How did you figure that out?” “What are you trying to figure out?” and/or “Can you think of another way to do that?”

2. Reason abstractly and quantitatively

This standard brings to light the concepts of contextualizing and decontextualizing content. Teachers should model for students the process of breaking down problems to the point of pictorial representations to guide them through concepts that cause students to struggle. This standard represents the point at which students begin to recognize that a number represents a specific quantity, and they connect that quantity to a written symbol. Teachers can support this learning by asking questions such as, “What do you know about the number 4?” “How can you show me 4?” “Is there another way you can make 4?” and/or “How do you know which one has less/more?”

3. Construct viable arguments and critique the reasoning of others

Talking about the mathematical process while working through problems is essential. The expectation is that students question one another and their processes. Creating an environment in which students will gain a stronger understanding of mathematical language and processes is critical. When engaged in this standard, preschool students will create justifications for their answers and listen to the arguments of others related to how they solved the problem. Teachers can reinforce this standard by asking questions such as, “How can you be sure that____?” “Will that strategy still work if_____?” and/or “How/why did you decide to try that?”

4. Model with mathematics

Consider mathematics outside the confines of a math lesson. Through this standard, teachers show students the application of mathematics to real-world problems, data collection, and analysis as well as an understanding of applying logic to the world around us. Teachers in the preschool classroom can support this standard by looking for opportunities throughout the day that require real-life problem solving and helping children discover solutions through the use of manipulatives, acting problems out, and/or creating drawings.

5. Use appropriate tools strategically

Students select an appropriate tool for use within the classroom as well as in real-world

experiences. This requires a teacher to allow students to seek out appropriate tools and not always provide step-by-step directions. In a preschool classroom, teachers can provide a variety of manipulatives with multiple uses for problem solving, such as using non-standard measurement tools and providing puzzles on a computer in addition to puzzles in the classroom.

6. Attend the precision

Exactness and meticulousness are used when students speak of and practice mathematics. Encourage students to move past the expression, “I don’t know” to using exact language to mathematically talk through where their understanding is halted within a process. In a preschool classroom, teachers can support this by using rich mathematical language throughout the day so students can refine their language into more mathematically specific vocabulary. In addition, teachers can provide opportunities for mathematical discussions among students, which further helps to grow their mathematic-specific vocabulary.

7. Look for and make use of structure

Encourage students to find patterns and repeated reasoning, which helps students as problems become more complex. In a preschool classroom, this goes beyond seeing linear patterns of “red, blue, red, blue” to the more complex patterns seen in numbers. The teacher can support this by pointing out patterns of repetition in numbers, visual patterns found when subitizing, and/or emphasizing that, when one is added to any number, the answer is always the next number on the number line.

8. Look for and express regularity in repeated reasoning

Students must be able to generalize their thinking and not focus on just the one problem in front of them. Students should work to keep the big picture of a problem in mind while they work on finite pieces during the problem-solving process. Students can also look for shortcuts by understanding that certain consistencies exist in math, such as number order, and when 0 is added to any number, the number always stays the same.

Effective math instruction happens all day long and across the curriculum. When teachers offer math-related language or “math talk” while children are actively engaged in their own pursuits, children’s ability to understand and apply those concepts increases over instruction that involves math talk provided only during whole group lessons (McCray, 2007).

Not only should teachers model “math talk”, but they should also ask questions that help children expand their thinking and use their own math vocabulary. This can be done as children are prompted to explain why they believe their answer is correct or how they arrived at a solution. It is important to encourage students to have math conversations with each other. Young children can share their mathematical thinking, work together to solve problems, explain how they solved a problem, and discuss alternate ways of solving problems. The conversations children have about math should be less focused on the correct answer and more focused on the process used to arrive at an answer. Mathematical conversations support and extend children’s thinking and solidifies their understanding.

Once early educators have explicitly taught a math lesson, time must also be provided for children to play and experience math. Play combined with math talk is as important as an explicitly taught lesson. Children at play can learn essential math skills, such as counting, equality, addition, subtraction, estimation, planning, patterns, classification, and measurement. According to the Joint Position Statement on Math published by the National Association for the Education of Young Children (NAEYC) and NCTM, play does not guarantee mathematical development, but it does offer rich possibilities and instills the understanding that math skills are accessible to all (NAEYC/NCTM, 2010; Clements & Sarama, 2004).

The NRC and NCTM identified the following three areas as essential preschool math focal points:

- Numbers and Operations
- Geometry
- Measurement

To achieve depth of instruction, the majority of a preschool math curriculum's instructional time should be focused on teaching numbers and operations, followed by geometry, and finally measurement, rather than covering every topic or every skill with the same weight. While data analysis and algebra are also important, they should not be given the same amount of instructional time as the first three; instead, they should be woven into the first three (NRC, 2009; Fuson et al., 2010).

Numbers and Operations

Numbers and operations are the primary curricular focal point and should be the primary goal for instruction in preschool. This is the area in which the most math instructional time should be spent. Quantity or number sense can be as important to math development as phonemic awareness is to emergent literacy. Just as children need to hear language, rhymes, and sounds for early literacy, they need experiences with numbers and operations to fully develop their number sense (NRC, 2009; Fuson et al., 2010; McCray, 2007).

Numbers and operations are more than simply recognizing numbers and counting; they also involve a conceptual understanding of numbers and what they represent. Numbers and operations are made up of three major components:

- Number Core
- Relations Core
- Operations Core

Number Core

This component is the largest element of numbers and operations and contains the most crucial skills for numerically proficient children. Those skills include cardinality, knowing the number word list, one-to-one correspondence, and written number symbols.

Cardinality is recognizing that the last number said is the number that represents the set of

objects. Simply stated, it is knowing how many you counted. Often, children will count a set of items such as 6 buttons, then if a teacher picked up the last button she counted in the set, she might tell you that button is six. Children must learn to remove the labels of the number words from each individual item and gain an understanding that the last number they stated represents the entire collection, not just the last item. When first teaching cardinality, it is important to start with a small group of items arranged in a row, count from left to right, and make sure the items being counted are of similar size and shape.

Once children seem confident with cardinality, teachers can deepen their level of understanding by asking a child to start in the middle or at any point along the set of objects and count and tell you how many they have. This incorporates order irrelevance or an understanding that it doesn't matter which order in which you counted the set, there are still the same number of items. Finally, children need to learn object irrelevance or gain the understanding that items do not have to be the same size or shape to be part of a set that can be counted (Clements & Sarama, 2009).

The next skill included in the number core is **knowing the number word list**, often referred to as rote counting. Children need to learn that there is a stable order in which to say the number word list, and it is the same every time. By age 3, most children understand that numbers go in a certain order, but they will often skip numbers and don't have a good sense of the entire number word list. This happens because children learn the number word list as a string of words without meaning. Once they begin to attribute meaning to the words, you might notice that the children who once could count to 10 or 20 without skipping begin skipping numbers or getting them out of sequence. It can appear as if they have stepped backwards in their learning, but they haven't. They are making sense of the number words and how they fit together, and they will soon swing back to a stable count order and continue their growth (Brownell et al., 2014).

Once children can consistently count starting at zero or one, it is important to begin working with them to begin counting from any number and counting on. The ability to start at any given number and count onward is a precursor to addition and subtraction. This is a skill that cannot be taught or practiced too much. It is important to create fluidity and automaticity in counting so as to allow children's brains to focus on higher-level math skills. There are several steps involved in problem solving; if children have to think about the number word list, they are unable to perform more difficult counting tasks, including making comparisons between two groups and basic addition or subtraction. Multiple opportunities to practice can become more effective when paired with a movement for every word in the list, such as clapping, stomping, or jumping (Clements & Sarama, 2009). However, overemphasis on rote counting to high numbers before establishing counting principals such as cardinality and one-to-one correspondence with small numbers is counterproductive. The goal in preschool mathematics is to gain a deeper understanding of numbers and what they represent (Brownell et al., 2014).

One-to-one correspondence is another skill housed within numbers and operations. This is the understanding that each item you are counting gets one and only one count. This skill should be paired with cardinality to help children develop the understanding that the purpose of counting is to determine "how many." Fluency in counting objects in combination with knowing the number word list is a crucial skill for children to move forward in higher-level mathematical concepts.

The final piece of numbers and operations is the **written number symbol**. Children should be able to recognize the written numeral and understand that it is a symbol that represents a conceptual understanding of a set of four. The quantity of four is so much more than a “4” written on a page. As children develop meanings for the written numerals or number symbols, they should also compare these numerals with the quantities they represent. Using multiple representations for the quantity of each numeral helps to build conceptual understanding. This might look like matching the numeral to the time on the clock, to a pattern on a die, and to objects in a set (Fuson et al., 2010).

Relations Core

This component is about relationships, which can be determined by looking at attributes of a set. To support this skill in the classroom, it is important to provide not only visual comparisons but also multiple opportunities to build connections between those visual sets to number words and quantity terms (e.g., a group with 5 bears is more than the set with 3). The greater the use of a variety of words to describe comparisons, the stronger the vocabulary children will acquire and be able to use in their own math talk. Preschool teachers tend to concentrate on the “bigger” attribute, such as which has more, which has the most, and which is longer. It is important to broaden children’s vocabulary and understanding by giving equal time to the concepts of less, smaller, fewer, and shorter (Clements & Sarama, 2004). To give children a real sense of number size and support their ability to make reasonable comparisons, include benchmark collections of sets of objects posted in your room, such as sets of 3, 10, 20, 50, and 100. When doing estimations, support students’ learning by teaching them to use those benchmark collections so they are not just guessing how much, but also to have an anchor to help them make educated predictions (Brownell, 2014).

Included within the relations core are the skills of **conservation of number and subitizing**. Conservation of numbers is another concept preschool-age children acquire. Children grow in their understanding that the number remains the same regardless of how items in sets are distributed or their likeness in size or shape. Prior to a child developing conservation of number, they tend to focus on their perceptions of things rather than the factual information. For example, when objects in 2 groups are a different size or shape, even after counting them, a child will perceive the group with the larger items to have more. The same is true if the items in one group are spread out, making a longer line. Once they gain conservation of number, children understand that there are the same number of items in a group, and they begin to consider the factual information of how many they counted over the perceptual information of how it looks.

Providing multiple opportunities to count and recount the same number of items in different configurations and talking about their results help to solidify young children’s conservation of numbers (Fuson et al., 2007).

Subitizing involves seeing sets and knowing how many there are without physically counting every item. Subitizing introduces basic ideas of cardinality, or how many, as well as more and less, parts and whole, and quantity. It also has a direct link to addition and subtraction. Subitizing is one of the main abilities young children should have opportunities to develop and can be an

area that is lacking, especially among children from low-resource communities and those with special needs (Clements & Sarama, 2004). When helping children acquire the skill of subitizing, it is important to change the configurations of sets so children are not just memorizing a visual pattern, but truly gaining a sense of how many. Always start with linear patterns, followed by a domino or dice configuration, leaving random scatters for more advanced practice, as they are the most difficult for children to subitize. It is also important to use similar shapes on a contrasting background. Teachers should avoid using cute pictures and busy backgrounds that might prevent children from seeing the set clearly. Subitizing practice can be done with dots on a page or with simple manipulatives, such as lacer links or inch cubes on a table. Teachers should quickly show children different arrangements of items of 1-5 and ask them how many they saw. In addition to supporting an understanding of how many and quantity comparisons, subitizing also helps to develop an understanding that there are numbers within numbers. For instance, 5 can be made up of 3 and 2 or of 4 and 1. If we only present numbers through manipulatives in a straight line, children tend to live in “one’s world” and do not see how numbers can be composed. As you begin to work with numbers larger than 4, it is important to emphasize the numbers within the numbers. If 7 is presented in a straight line of dots or manipulatives, the tendency is to count each dot or manipulative. However, if we present 7 as a 3 and a 4, we begin to encourage students to see numbers as compositions of other numbers. This is a critical element of quantity and a precursor to addition and subtraction (Clements & Sarama, 2009; Fuson et al., 2010).

Operations Core

The Operations Core deals with the addition and subtraction of objects. In preschool, when working on basic operations, students should always start with some type of concrete object. This also helps to put the problem in a story form and use physical objects related to the story. The movement involved when children use manipulatives or act out a story problem helps to anchor their learning and solidify their understanding of what it means to add and subtract. Fingers are a great manipulative as well. One can allow and even teach children to use their fingers when solving problems. There is no need to worry about fingers becoming a crutch for students. Once children gain a better understanding of mathematical processes later in life, this strategy is replaced by more efficient ones (Clements & Sarama, 2007). When children become proficient at using manipulatives through story problems, they can then move into drawings to solve their equations. Only at this point should they be introduced to written expressions and equations using appropriate terminology and symbols (+, −, and =). Having multiple words in their vocabulary for similar actions helps support their conceptual learning of the skill. When teaching addition, use a variety of terminology, such as *add*, *join*, *put together*, *plus*, *combine*, and *total*. Subtraction vocabulary includes *minus*, *take away*, *separate*, *difference*, and *compare*.

Geometry

Geometry is the second mathematic focal point determined by NRC and NCTM. While focused instructional time in geometry is needed at the preschool level, it is recommended that the time spent on these concepts be less than the time devoted to numbers and operations (Fuson et al., 2010). From the earliest years, children learn about shape and spatial relationships. At first, they are not able to distinguish circles, triangles, and squares from each other, but gradually they

develop a richer sense of the parts and attributes of these shapes, along with the ability to orient them in a space (Fuson et al., 2010).

There are three components to geometry that are important for young children to learn:

1. Shape and Structure
2. Composition and Decomposition of Shapes
3. Spatial Reasoning

Shape and Structure

The shape and structure component focuses on teaching children to recognize two- and three-dimensional shapes. Children learn their understanding of shapes based on example; therefore, children will develop a more accurate sense of shape when they are exposed to a wide variety of shapes within each category. Children also need to be exposed to examples of shapes beyond circles, squares, rectangles, and triangles; otherwise, they will develop a limited understanding of shapes. For instance, children might not think of a trapezoid as a shape, because it's not a shape that has a name they know. Forming accurate mental models of shapes is important, but not sufficient. When teaching children about shapes, it is also important to include vocabulary that helps them analyze shapes and understand that shapes are characterized and defined by certain parts or attributes. For example, a triangle has three sides and three corners or vertices, and a square has four sides of equal length. When teaching shapes and their attributes, make sure to include a wide variety of vocabulary that includes both common names and appropriate mathematical terms such as oval and ellipse, corners and vertices, and ball and sphere (Fuson et al., 2010; Brownell et al., 2014).

Composition and Decomposition of Shapes

Composition and decomposition of shapes helps children understand that shapes can be taken apart or put together to create other shapes. For instance, two triangles can be put together to create (compose) a square, or a square can be taken apart (decomposed) to create two triangles. Show children that shapes can also be transformed when they are used to fill other shapes or put together to create pictures, much like children do when using pattern blocks and picture cards. Symmetry is also an integral part of the composition and decomposition of shape. Symmetry includes flipping the same shape over, sliding it, or rotating it into new positions to duplicate designs and three-dimensional structures (Clements & Sarama, 2009).

Spatial Reasoning

Spatial reasoning includes two main abilities: spatial orientation (i.e., knowing where you are and how to get around) and spatial visualization (i.e., building and manipulating objects mentally). Children's skills are initially based on their position within an environment, but they quickly expand to include external references. To teach spatial reasoning, it is important to include spatial vocabulary such as "on, in, under, and over" in your daily language with children and also to provide interesting environments for them to explore and navigate. When going to typical places (e.g., recess or the restroom) with young children, talk about the landmarks you

see on the way (i.e., drinking fountains, pictures on the wall), or the routes you take to get to your destination. To deepen children's understanding, encourage them to draw maps beginning with very familiar areas (e.g., their bedroom, their home, the playground, or the classroom) and then extend it to have them create maps of a city they built in the block area or a zoo they have created in dramatic play (Fuson et al., 2010).

Puzzles are another tool to teach spatial reasoning, especially spatial visualization. Children build these skills as they visualize the pieces and work to determine where a puzzle piece fits or how they might turn it to get it to fit. A great tool to increase the speed at which children acquire spatial reasoning and visualization skills are computer puzzles. This is one area in which computers can be more effective in preschool than hands-on manipulatives. A child might turn and manipulate a physical puzzle piece and not really pay attention to what they have done or how they moved it. On a computer, they have to be aware of the decisions they are making to put the piece in the appropriate spot. This process helps them articulate what they have done more effectively and solidifies their learning of spatial reasoning (Clements & Sarama, 2009).

Measurement

Children who are surrounded with interesting objects, such as blocks and sensory tables with a variety of containers, are naturally led to discover relationships among them and how they are the same or different. The more frequently children make comparisons, the more complex their comparisons become. Measurement develops from a need to compare two or more objects in a variety of ways. It has a way of bringing both geometry and numbers together as children explore and experiment with their comparison. When making comparisons with numbers, it is important to teach both sides of specific measurement terms (e.g., more and less, same and different, heavy and light, longer and shorter, full and empty) and to incorporate specific measurement terms into your daily vocabulary whenever possible.

While measurement is important, the NRC and NCTM recommend that only a small amount of instructional time be spent on this third focal area (Fuson et al., 2010). The focal area of measurement involves skills for identifying measurable attributes and making comparisons based on those attributes, including length, area, and volume.

As children begin to measure using non-standard units, teachers support their learning by helping them recognize the need to measure by using the same unit. Children often see no problem mixing non-standard units as they measure, for example using both blocks and paperclips at the same time to cover what they are trying to measure. Children must learn that, when units are not equal, they are not units that can be used for measuring. Once children have measured something and are counting the units, they always need to clarify their units by labeling them, using the measurement terms, not just the number count. For example, teach them to say, "the flag is seven blocks long" instead of "the flag is seven." Another common error children make is leaving gaps between the units instead on aligning them end to end. You can help children develop an understanding of the necessity to align the objects without gaps by comparing that child's results with the results of another child who measured the same item with the same units without gaps. Initiate conversations about the varying results, helping them discover the reason for the different

measurements (Brownell, 2014).

Once children become proficient at measurement using non-standard units, teachers can further their understanding by teaching them the relationship between the size and number of the non-standard units used. This is done by comparing the results of measuring the same object multiple times using a variety of manipulatives. For example, when measuring the length of a table, have one child measure using inch cubes while another measures the same table using a block from the block area. Discuss the results and the children's conclusions about why they came up with different number amounts in their measurement.

Finally, preschool is the perfect time to begin to support children in making indirect comparisons using a third object. For example, the children can dig two holes on the playground and use a stick to see which one is deeper (Clements & Sarama, 2004).

Algebra and Data Analysis

The foundations for data analysis in preschool lie in other areas such as counting and classifications. The calendar serves as a connection to the focal points of numbers and operations and geometry. As children learn to sort objects and quantify their groups, they also gather data to answer questions, classify those answers into categories, and quantify their responses (Clements & Sarama, 2009). Data analysis has deep connections to the other focal point areas; NCTM does not recommend giving data analysis its own block of instructional time, but rather recommends combining it with the other areas.

Algebra at the preschool level involves finding patterns in the world. However, the concept of pattern goes beyond the typical practice of making patterns in preschool classrooms, which involves creating simple sequential patterns such as red, blue, red, blue with manipulatives or on a paper chain. It includes seeing more complex patterns, such as the perceptual patterns found on dominoes, the patterns found in the number world, the repetition of numerals 0-9, and the pattern of one more when counting and adding (Clements & Sarama, 2009). It's important for teachers to understand patterning in all its forms, so they can take children beyond simple linear patterns to a way of thinking about patterns that support them in making mathematical connections. This is done by talking about patterns not only in terms of the ABAB pattern and its variations (e.g., AABAAAB and ABCABC), but also assigning numerical value to patterns, identifying when there are two of something and then one of something else, or noticing that every third one is yellow. These deeper conversations help children make mathematical generalizations (e.g., when adding a zero to a number, the sum is always that number, or when you add one more, the sum is always the next number in the number sequence). It is important to tie this type of algebraic thinking to both numbers and shapes.

Calendar

When thinking about preschool mathematics, many teachers immediately think about "calendar time" and believe it infuses math into the student's day. The calendar seemingly provides the time to teach patterning, numbers, and the number word sequence on a regular basis. However,

scholars (Ethridge & King, 2005; Beneke, Ostrosky & Katz, 2008) have questioned the calendar as a context for preschool mathematics and the breadth/depth of the mathematical learning the children actually receive during a typical calendar routine. When reflecting on the value of incorporating calendar time into preschool, teachers must consider their instructional goals for this routine and whether the skills being taught and the strategies used to teach those skills are developmentally appropriate.

To participate meaningfully in calendar activities, young children must understand that time is sequential (i.e., yesterday, today, and tomorrow; morning, afternoon, and evening; Sunday, Monday, Tuesday, and so on). Children also must be able to conceptualize before and after and think about future and past events. While preschoolers can recall past events and talk about what will happen, most do not understand the concepts of yesterday, today, or tomorrow and are not able to talk about these events in terms of units of time, such as days or weeks. The ability to judge the relative time from a past event or until a future event typically is not in place until sometime between the ages of seven and ten (Beneke et al., 2008; Ethridge & King, 2005).

While children can learn to recite the days of the week and months of the year, they assign little meaning to them. Psychological time, which focuses on the important events in a child's life or the life of their family (i.e., birthdays, trips, and events), is much more relevant to young children than time on a clock or days on a calendar and does not correspond to regular units of minutes, hours, days, and months.

Early educators sometimes use the calendar to teach concepts other than time, such as sequencing, patterning, and number recognition. However, this too has its own set of complications. The seven-column, five-row grid of a calendar interferes with children's understanding of our base-ten system. The calendar grid gets filled in a different way each month, the day a month begins is different every month, and the number of days is variable; this prohibits children from seeing true patterns in the numbers. Seven is an unnatural break in our 0-9 sequence of digits and doesn't support children's use of their natural counting tools – their fingers (Brownell et al., 2014).

The 10-20 minutes spent on the calendar during a preschool day would be more productively spent on intentional math instruction, which gives preschool children opportunities to explore and experiment with math concepts, use concrete materials, and interact with a responsive adult to question and guide learning (Brownell, 2014; Beneke et al., 2008).

Standards and Curriculum

The [Kansas Early Learning Standards \(KELS\)](#) document provides a starting point for teachers and curriculum committees. The KELS document offers information and guidance to preschool providers on the developmental sequence of learning for children from birth through kindergarten. Aligned with the Kansas K-12 Standards, the KELS are structured around domains for learning that include a whole-child perspective.

The KELS were not designed to serve as an assessment or a curriculum. Rather, they were

designed to guide educators in selecting curricula and assessments focused on the skills and the knowledge young children should have as a result of participating in high-quality preschool programs. An understanding of early math development, the curriculum focal points of early math, and evidence-based instructional strategies are fundamental considerations when selecting preschool mathematics curriculum materials.

The Kansas MTSS system of alignment advocates for the selection of a comprehensive, evidence-based preschool curriculum that addresses all domains of learning outlined in the *Kansas Early Learning Standards*. While your MTSS efforts are focused on academics and/or social behavior, when it comes to intervention, it is important that programs use curricula that address the needs of the whole child. Programs are encouraged to use resources such as the [Head Start Preschool Consumer Reports](#) and/or the [What Works Clearinghouse](#) to examine the evidence-base of different preschool curricula.

In addition, programs should examine their selected curriculum to determine whether the three focal points for mathematics instruction are adequately addressed. Some comprehensive curricula provide strong support for early mathematics, while others might not include all three essential areas with the appropriate weight. If this is the case, supplemental mathematic materials might be necessary to strengthen your overall program and ensure that students' outcomes are maximized.

Professional Development, Curriculum Fidelity, and Communication

Once a program has determined what its comprehensive and/or early mathematic curriculum will be during the implementation of its beginning MTSS efforts, the leadership team should record this information on the Preschool Integrated Protocol with enough specificity to ensure that all teachers can implement the curriculum with fidelity. Typically, curricula contain more components/content/days than can be implemented within a classroom day or year. Leadership teams should decide what parts of their curriculum are essential elements and what are up to teacher discretion. It will be important when comparing data across classrooms that there be some consistency regarding what and how the preschool curriculum is taught. It is also important to keep in mind what the curriculum itself considers critical elements. For research-based curricula that have demonstrated positive outcomes, decisions to eliminate or reduce the time spent on an essential element can impact the results your program might produce.

Leadership teams should also make decisions about expectations regarding the daily schedule. A preschool program's daily schedule is a critical component of curriculum and instruction. Depending on your program's philosophy and/or requirements, you might want to determine how much time should be expected for self-directed learning, how much time should be teacher directed, the maximum duration of a teacher-direct activity, etc. This step will ensure that leadership teams have outlined an achievable and developmentally appropriate expected use of their preschool curricula and help provide consistency in implementation across classrooms. Teams should create a sample schedule with the expected time allotments for the day. Decisions about what parts of the curriculum must be implemented, in what types of settings (whole group, small group, play), and for how long (how long a typical whole group should last, how much time should be spent outside or in play) should then be documented and communicated to

teachers.

Whether implementing a new curriculum or refining the use of a current curriculum, professional development is another task leadership teams should take the time to consider and plan. Creating a plan for professional development is a critical step in ensuring fidelity and sustainability.

Teams should consider the following questions:

- What training will staff members need to implement curriculum expectations?
- Who needs to know the expectations?
- When and how will the curriculum expectations be communicated to staff?
- What type of follow-up will be needed?
- Who will communicate the expectations to new staff members?
- How and when will new staff members receive training on your curriculum?

Leadership teams should plan for both their communication and professional development needs each time they meet. Communication is an important aspect of achieving staff buy-in and sustained change. Therefore, while developing a communication and professional development plan, teams should ensure that there is bidirectional communication. A one-way communication plan can get the message out, but it does not easily allow for feedback. Reciprocal communication is critical for a leadership team to create a plan the staff will support.

Once these decisions have been made and documented, leadership teams should also consider how they will monitor the fidelity of the implementation of their plan. Monitoring fidelity of curriculum implementation is not meant to be punitive; rather, it is intended to provide information for leadership teams to use when making data-based decisions regarding their MTSS. Curriculum fidelity data can provide insight into the needed professional development, assist teams in making determinations about curricula, and/or help leadership teams decide whether the expectations they outlined are appropriate and possible. Using the expectations that were outlined for teachers regarding the Preschool Integrated Protocol, a checklist can be created to chart your curriculum expectations. This checklist could be used by an administrator during walkthroughs, as a reflective self-assessment, or as a peer-mentoring tool. How the fidelity checklist will be used and how fidelity will be monitored is up to a leadership team based on the needs of their system.

Assessment

Comprehensive Assessment Plan and Data-Based Decision Making

Preschool programs already use a variety of assessment tools for a variety of purposes. Developmental screening tools (e.g., DIAL, ASQ) are used to determine which students might have developmental delays and need further assessment. Diagnostic assessments (e.g., Braken, Brigance, PLS, Peabody Motor Scales) often compare children to a standardized sample and are most generally used to determine whether a child might qualify for special education or other services. Curriculum-based assessments (e.g., AEPS, Carolina, Teaching Strategies Gold) are used multiple times per year to measure a child's progress over time and help teachers in planning core curriculum. Program assessments (e.g., ECO, Kindergarten Readiness Snapshot) are often measures required by funders and used to evaluate the overall effectiveness of

programs. In the Kansas MTSS process, the first step in creating a comprehensive assessment plan is to consider the assessment tools you are already using, the purposes for which you are using those tools, and whether there are tools or practices that are duplicative in purpose or are no longer necessary. This information should be documented on your district's Comprehensive Assessment Plan along with other decisions your leadership team makes about the assessments that will be used in your program.

Universal Screening

The next step in the MTSS process is to determine what your program will use as a universal screening tool. Unlike developmental screening tools, a universal screening tool is used to compare students to a normative sample or standard for the purpose of identifying which students might be at risk for later learning difficulties based on indicators that are predictive of later achievement. A developmental screening tool identifies children who might have a developmental delay, while a universal screening tool identifies students who might be at risk and ranks them into levels/tiers based on that risk. This distinct difference makes the data from universal screening tools particularly helpful for examining the effectiveness of your curriculum and supports a process for tiered intervention.

Universal screening tools appropriate for early mathematics assess the skills related to number sense. Typically, these skills include counting, cardinality, number recognition, and quantity comparisons. They are valid and reliable for this purpose, can be used with confidence to make instructional decisions, and can be given at least three times per school year. The document *Preschool Universal Screening Tools* can be found in the appendix and can assist teams in selecting universal screening tools appropriate for preschool programs. Leadership teams must ensure that they have a tool that examines the predicative elements of early mathematics.

Creating a comprehensive assessment system is one of the major structuring tasks that must be completed by your leadership team. The Kansas MTSS and Alignment recommends screening preschool students at least three times per year using a universal screening tool. This information should be reviewed alongside the elementary universal screening data to support discussions related to the adequacy of your preschool curriculum, the match between your preschool and kindergarten scope and sequence, and the information necessary to meet the needs of individual students. When comparing preschool and elementary data, leadership teams should keep in mind the make-up of their preschool population and how it differs from the kindergarten population. In most school systems, not all kindergarten students attend a public preschool program. Additionally, the students who do attend preschool in a public school often had to qualify for that program because they met at-risk criteria or were receiving preschool special education services.

Your leadership team will use universal screening data to examine the adequacy of your curriculum and your system's need for professional development. Classroom staff members will use universal screening data to plan for differentiated instruction within the core curriculum to identify students in need of additional support for mathematics and to determine the focus of that intervention. Each universal screening tool sets the criteria for determining which students are at or above benchmark and which students need Tier 2/3 support. Programs should follow the

decision rules for the tool they select when using this information to group students into levels of tiered support.

Progress Monitoring

Progress monitoring is conducted within the Kansas MTSS and Alignment to inform staff members of students' growth related to content knowledge and skills. Regular progress monitoring and use of the data when making instructional decisions results in students making more academic progress than when teachers do not use progress monitoring. Teachers' accuracy in judging student progress increases when progress monitoring strategies are used consistently (Stecker & Fuchs, 2000).

For preschool students in the core (Tier 1), progress monitoring is often conducted using curriculum-based assessments (e.g., AEPS, Teaching Strategies Gold), administered three to four times per year. These assessments are tied to content-area instruction and help teachers determine whether students have learned the concepts and skills taught so that the subsequent instruction can be adjusted to re-teach concepts or provide additional practice of skills not yet mastered.

For students receiving supplemental (Tier 2) and intensive (Tier 3) instruction, progress-monitoring data are used to chart the growth of individual students regarding the skills being targeted in intervention. Progress monitoring for students receiving supplemental or intensive instruction addresses two questions:

1. Is the intervention working?
2. Does the effectiveness of the intervention warrant continued, increased, or decreased support?

Unlike the K-12 MTSS system, preschool universal screening tools generally cannot also be used as progress monitoring tools, because they cannot be given with enough frequency to monitor intervention effectiveness and make changes to the level of intervention a student receives. Instead, preschool programs are encouraged to use mastery monitoring strategies to assess and monitor the progress of students receiving tiered intervention. Mastery monitoring strategies are teacher designed and involve directly collecting data on a student's mastery of the specific skills being taught in intervention. Typically, changes to the level of tiered instruction a preschool student receives will only happen after each universal screening benchmark period; however, teachers can use the data they collect through mastery monitoring, and their knowledge of the child to make changes when the intervention efforts (including the intensity of embedded learning opportunities) does not seem to be effective or indicate whether a change is needed.

Collecting and graphing progress-monitoring data over a series of weeks will provide a visual pattern of skill acquisition for students receiving additional support. The Kansas MTSS and Alignment recommends that mastery monitoring data collection in preschool occur at least one time every two weeks for students receiving Tier 2 support and one time every week for students receiving Tier 3 support.

Diagnostic Assessments

It is not generally necessary for leadership teams to identify a formal diagnostic process to determine an instructional focus in preschool. The skills being assessed at the preschool level are often basic enough to not warrant deeper evaluation. In the K-12 MTSS and Alignment system, diagnostic assessments are used to help narrow down the focus for intervention. Preschool early math intervention will focus on the number core. Some published protocol interventions, if selected, do have informal assessments that can be used to place a student into the appropriate level of the program and could be used at the preschool level.

Professional Development, Assessment Fidelity, and Communication

Once assessments and assessment processes have been selected, your leadership team should plan for appropriate professional development and ongoing support to all staff members who are expected to use these tools and processes. Decisions need to be made about who will administer the universal screening tools, score the assessment, and enter data into your database. If all teachers are involved in the administration of an assessment, they will need to be trained and supported to ensure the fidelity of assessment administration. Sometimes programs choose to create an assessment team to collect universal screening data, in which case those team members need training. Regardless of whether every staff member administers the assessment or a team does, all staff members must understand the purpose, rationale, uses of the assessment, and how to interpret the instructional implications of data. Initial and ongoing training should be differentiated according to the expected use, alignment of practices, and each staff member's prior knowledge.

It is important to monitor the fidelity of assessment administration, especially when it is new for staff. Fidelity monitoring helps ensure that all data are valid and reliable. There are three main areas to be considered:

1. Are assessments administered and scored by staff members who have been trained to do so?
2. Are assessments administered according to the assessment calendar?
3. Are assessment results correctly interpreted and used to guide intervention?

Effective techniques to minimize scoring errors while ensuring fidelity include making sure examiners have the following:

- Excellent training
- Opportunities to practice
- Periodic training review
- Experienced examiners mentoring/checking first-time examiners' scoring
- Opportunities for shadow scoring (two examiners score the same student, thereby allowing them to compare scores)

Within the framework of professional development, the best opportunities for ongoing professional development among staff members come through commissioning new examiners to work with the experienced examiners and providing opportunities for shadow scoring. Such

opportunities should be included within the professional development plan as implemented and monitored by your leadership team.

In planning for professional development, it is helpful for leadership teams to consider these questions specific to each assessment method:

- Which staff members are expected to administer the assessment?
- Which staff members will not be administering the assessment but will be involved in interpreting the instructional implications of the results?
- Which staff members, if any, have experience with or have previously received professional development on the assessment?
- Which staff members need to attend initial professional development on the administration of the assessment?
- Which staff members need to attend initial professional development on the interpretation of the assessment?
- When (date) will staff members first be expected to administer the assessment?
- When (date) will initial professional development be provided?
- Who will provide the professional development?
- Who will monitor the correct administration (fidelity) of the assessment?
- What method will be used to monitor the correct administration (fidelity) of the assessment?
- How frequently will the administration (fidelity) of the assessment be monitored?
- When and how will ongoing professional development for staff members be provided?
- When and how will professional development for staff members needing additional support in effective assessment administration be provided?
- Who will provide professional development for new staff members, and how will it be provided?

These questions are designed to help leadership teams as they begin the development of an overall professional development plan. Once specific decisions are made, the leadership team should record the results on the professional development plan and organize how these decisions will be communicated with staff. Once again, it is important to remember that communication is a key aspect of achieving buy-in and sustainability. Therefore, procedures are designed and executed to ensure regular and consistent communication about what is happening regarding your MTSS efforts, not only among the leadership team, but also with all stakeholders. It does not have to be a large, formal plan; it only needs to be as large and formal as necessary for the leadership team to ensure that bi-directional communication occurs as planned.

Leadership teams also need to consider communication with various stakeholders regarding how, when, and what assessments are given. Staff members will need to know about decisions regarding changes in assessment practices. Parents are also interested in assessments in which their children will be participating, and leadership teams will need to discuss how the results of assessments will be shared with parents. The leadership team should make decisions regarding what information is appropriate to share with which stakeholders and when that information

should be shared.

- Who needs the information about assessments?
- What information do they need?
- When will communication occur?
- Who will provide the information?
- How will the communication be provided?
- What feedback or input will be requested?
- How will the feedback/input be used?

Once the leadership team develops a communication plan regarding assessment, the plan should be implemented and then regularly reviewed at leadership team meetings. Any communications that have occurred or feedback that has been received can be shared with team members, and any needed revisions can be planned and implemented. In this way, consistent communication between the leadership team and stakeholders is ensured.

Tier 2/3 Grouping for Preschool Math Intervention

Preschool populations by their very nature include children with a wide variety of skill levels. Therefore, preschool daily schedules are designed to provide multiple opportunities for differentiated instruction along the developmental continuum. *All* children, including those needing support through Tiers 1, 2, and 3, should participate in the core mathematics curriculum with differentiation provided. Differentiation of core curriculum is considered an element of Tier 1 for all students.

When considering how to provide interventions for students needing Tier 2/3 support, the Kansas MTSS and Alignment recommends that preschool programs not follow the intervention models typically used in K-12 programs. Instead of grouping students across classrooms or bringing in someone the child does not know, Tier 2/3 intervention should ideally be provided in a child's classroom by familiar adults. It is especially important for young children to develop positive and secure relationships with adults. Research suggests that preschool teacher-child relationships play a significant role in influencing young children's social and emotional development (Fox & Hemmeter, 2009). Therefore, children identified through universal screening as requiring more support should receive that support through additional small groups and/or embedded learning opportunities within their daily routine and play.

Using the decision rules determined by your universal screening tool, children needing additional instruction in key early math skills will be identified to participate in intervention focused on a comprehensive intervention that encompasses the multiple skills included in number sense.

Tier 2

The Kansas MTSS and Alignment recommends that classroom teams consider at least one of two approaches when designing early math intervention for individual students. Classrooms can use a combination of both approaches to meet the individual needs of their students.

The first option involves the design of an additional small group (e.g., 3 or 4 students, 2 to 3 times per week for 10 to 15 minutes). Students needing Tier 2 support would be assigned to an intervention group based on the universal screening tool. Small groups could be provided in a variety of ways in a preschool classroom. Interventionists might pull students for a short time during self-directed learning activities or during other flexible times of the day (arrival/opening activities, transitions, snack time, etc.). Times for intervention can also be built into the daily schedule. Adults can work with all of the students in small groups of varying sizes and purposes. Interventions should be selected from the district's Tier 2 Protocol.

For some students/classrooms, it might make more sense to use the evidence-based strategy of embedded learning opportunities to provide a student with distributed practice across the daily schedule on intervention targets. Therefore, another option is to design an intentional schedule that provides a student with frequent documented embedded learning opportunities on targeted skills. The key to this option is the documentation of who, what skills, how, and when the embedded learning opportunities will occur and a method to ensure that each student receives the specified opportunities to practice each day. For this approach, teams will narrow down the learning target to a small set of skills that can be embedded based on developmental progressions. The use of a matrix, with the daily schedule listed vertically and the activities listed horizontally, can allow teams to create a process for when/who/how embedding will occur. The specific learning targets should be listed on each student's matrix, and a process to keep track of when the opportunities are provided should be documented.

To increase opportunities for practice, it is also recommended that, whichever approach is used, a learning center be intentionally designed based on early math targets. Classroom staff should encourage students needing Tier 2 support to participate in this targeted center multiple times per week. These learning opportunities should be designed to complement and extend what was learned in intervention as well as other early math topics addressed in the core curriculum.

Tier 3

Students who are identified as needing Tier 3 early mathematics intervention require more intensive opportunities to learn early math skills. Recommendations for Tier 3 look similar to those in Tier 2, but the intensity of the intervention should be increased through more frequent and smaller groups.

One option for intervention at Tier 3 is small-group instruction. In contrast to Tier 2, the group size for students needing Tier 3 intervention should be decreased, and the frequency should be extended (e.g., 1 or 2 students, 4 to 5 times per week for 10 to 15 minutes) to provide students more intensive support. Students needing Tier 3 support are assigned to an intervention group based on the need identified by the universal screening tool, and interventions should be selected from the district's Tier 3 Protocol.

The use of embedded learning opportunities can be an especially useful strategy for some students needing Tier 3 early math intervention. Therefore, another option within Tier 3 is to

design a schedule that provides a student with more frequent documented Embedded Learning Opportunities with targeted skills. This option also requires documentation of how, with whom, and when the embedded learning opportunities will occur each day and a method to ensure that students receive the planned embedded learning opportunities each day.

To increase opportunities for practice, it is also recommended that instructors encourage students in Tier 3 support to participate in learning centers proactively designed based on early math targets multiple times per week.

Tier 2/3 Protocols

Leadership teams will develop a Preschool Integrated Protocol that includes early numeracy. A protocol outlines a procedure or system of rules that govern the selection of intervention methods and materials based on the intervention area identified by the universal screening tool. Just as leadership teams determined the core curriculum, it is imperative that they consider what staff members will use to provide early math intervention. Protocols make it easier for staff to implement interventions because they do not need to design individualized interventions for each student. It also helps leadership teams as they examine data. If teachers are selecting from the same few interventions and students are not making the expected progress, leadership teams have documentation that different intervention materials and approaches are needed.

Leadership teams should identify current materials and critically evaluate them to ensure that the essential skills are represented and the materials will support targeted areas. Leadership teams must also consider the evidence-base of different interventions and instructional approaches. Prior to selecting, purchasing, or using any instructional materials, it is critical to carefully review the research base and match it to your student population. To assist teams in selecting the math interventions appropriate for preschool programs, the document *Preschool Early Math Intervention Ideas* can be found in the appendix.

In the Kansas MTSS and Alignment, the intervention curriculum protocol incorporates a portion of the protocol methodology and the problem-solving model. This is referred to as a hybrid model. In a hybrid model, a set group of interventions is defined to be used throughout the system. The interventions are chosen from a list of evidence-based approaches designed for specific areas of concern. Collaborative teams determine which intervention is to be used first, based on their universal screening data. Once the intervention begins, progress-monitoring data are used to determine if an intervention needs to be adjusted, intensified, or customized, based on pre-established decision rules (McCook, 2006). Once the curriculum protocols are developed, leadership teams should determine a management system for organizing and using the materials selected to ensure that all staff members providing supplemental and intensive intervention know where materials are located and how they are organized, thereby allowing for efficient planning for instruction.

The goal of interventions should always be to accelerate learning. If student performance indicates that this is not happening, the intervention needs to be adjusted. “If instructional groups are too large, instruction is not properly paced or focused, or too many intervention sessions are

cancelled, then impacts on student performance will be reduced” (Torgesen, 2006, p. 4). According to Torgesen (2006, p.4), one of the biggest risks of intervention groups is that we begin to expect a lower standard of performance for students who require them. For intervention groups to work properly, intervention systems require school-level monitoring and regular adjustments. This is accomplished in the Kansas MTSS and Alignment through collaborative teams who meet on a regular basis to analyze students’ progress, adjust instruction, and use the Self-Correcting Feedback Loop for communication. At least eight key aspects are involved in developing and maintaining an effective intervention system (Torgesen, 2006):

1. Strong motivation on the part of teachers and school leaders to be relentless in their efforts to leave no child behind.
2. A psychometrically reliable system for identifying students who need interventions in order to make normal progress in learning math.
3. A reliable system for monitoring the effectiveness of interventions.
4. Regular team meetings and leadership to enforce and enable the use of data to adjust interventions as needed.
5. Regular adjustments to interventions based on student progress. The most frequent adjustments should involve group size and time (intensity).
6. Enough personnel to provide the interventions with sufficient intensity.
7. Programs and materials to guide the interventions that are consistent with evidence-based research.
8. Training, support, and monitoring to ensure that intervention programs are implemented with high fidelity and quality.

Professional Development, Assessment Fidelity, and Communication

Once the intervention materials have been selected, it will be necessary to provide professional development that is comprehensive, sustained, and intensive enough to support all staff members who are expected to use the curricula to provide instruction. Simply having curriculum materials available does not ensure appropriate use. Staff members must have a working knowledge of the curriculum content and materials as well as an understanding of the planning and pacing process for lesson development. Leadership teams must set clear expectations that curricular materials be implemented and used with fidelity and provide professional development to support such outcomes.

Ensuring Fidelity of Intervention

A professional development plan for intervention curriculum should be dynamic in nature and result in intervention curriculum being implemented with fidelity. It is a plan that proactively identifies professional development needs based on individual staff members’ learning needs to utilize specific intervention curriculum/strategies. It ensures that staff members are accessing and utilizing curricular materials in the expected manner by planning for and conducting intermediate and follow-up activities. Activities for monitoring the fidelity of intervention curriculum implementation are not intended to be punitive, but rather should be understood as a part of the overall professional development plan. Many purchased curriculum and programs come with fidelity-monitoring tools, such as observation or walk-through forms. Leadership teams are

responsible for establishing a plan to monitor and support the correct and effective use of curriculum materials.

In planning professional development, it is helpful for a leadership team to consider the following questions specific to each curriculum selected:

1. Which staff members are expected to implement the curriculum/strategy?
2. Which staff members, if any, have experience with or have previously received professional development regarding the curriculum/strategy?
3. Which staff members will not be implementing the curriculum/strategy but will be expected to align instruction?
4. Which staff members need to attend initial professional development on the curriculum/strategy?
5. When (date) will staff members be first expected to use the curriculum/strategy?
6. When (date) will initial professional development be provided?
7. Who will provide the professional development?
8. Who and how will schools ensure that staff members have all materials necessary to implement the curriculum/strategy?
9. Who will monitor the use/implementation (fidelity) of the curriculum/strategy?
10. What method will be used to monitor the use/implementation (fidelity) of the curriculum/strategy?
11. How frequently will the use/implementation (fidelity) of the curriculum/strategy be monitored?
12. When and how will ongoing professional development for staff members using the curriculum/strategy be provided?
13. When and how will professional development for staff needing additional support to use the curriculum/strategy effectively be provided?
14. Who and how will professional development for new staff be provided?

Once decisions have been made and documented for Tier 2/3 interventions, leadership teams should create a plan for communication/dissemination.

Collaborative and district-level teams will need to know the plan so it can be carried out with fidelity. Leadership teams should consider the following:

- Does the communication plan need to be modified?
- Are there steps that need to be modified?
- Did the discussion of a communication plan for intervention lead to a need to develop an action plan or to add any items to the stop-doing list?

Step 1: Review and Validate Universal Screening Data

Critical Components:

- Who: District leadership teams, building/program leadership teams, and collaborative teams.
- What: Universal screening data.
- When: After each universal screening.
- Why: To ensure that the data collected are valid and reliable in order to make the most accurate instructional decisions.

Gather and Organize Universal Screening Data

When considering the mathematical needs of your preschool students and the adequacy of your Tier 1 mathematics curriculum and instruction, teams will view the universal screening data from multiple perspectives (i.e., district, building/program, classroom and child) at least three times per year.

During Phase 1, the district/program identified a universal screening tool for mathematics. Organizing these data for analysis at multiple levels is important to facilitate data-based decision making. To begin step 1, leadership teams will need to enter the child-level universal mathematics screening data into a data repository. While your universal screening tool might come with an accompanying database, many preschool universal screening tool databases do not allow teams to adequately evaluate the data from a district perspective, a program perspective, a classroom perspective, and a child perspective. Therefore, it might be necessary for leadership teams to place the data into a different format, such as an Excel spreadsheet with graphs or on paper using the *Universal Screening Program Summary Chart* (Appendix), to make the data useful for data-based decision making.

Data collection and preparation fidelity questions. Before making decisions based on universal screening data, programs must first consider the fidelity of their data collection and the validity of the data they have collected. The questions below are designed to assist leadership teams in this process. Teams should ask the following questions to assess whether the data were collected and prepared with fidelity:

- Did ALL children who attend your program participate in the universal screening, including children with disabilities and those who are dual-language learners?
- Were the directions for the administration of the screening assessment followed exactly? How do you know?
- Were the time limits for each test followed exactly? How do you know?
- Was shadow scoring used to check scoring fidelity?
- Were assessments given within the window for administration as outlined on your assessment calendar?
- Were all staff members who administered the assessment adequately trained?
- Has someone collected/organized the data for analysis?
- Is the data organized so your leadership teams can view it at the district/building/program level?

- Were there any barriers that occurred in collecting the data?

Validate the Data

Now that your team has all the data collected and entered into a format to view, the leadership team(s) should examine the data across classrooms to determine whether there are any patterns between classrooms that cannot be explained by the makeup of the classes. Congruence in this sense means that the data should look similar across classrooms with a similar make-up of students. The graphs should be similar enough (especially in the fall) that you can make valid interpretations at the program/district levels. If the data are incongruent without a reasonable explanation (i.e., a classroom with significantly lower scores might be the only classroom of students with significant disabilities), leadership teams should consider how to ensure that the data they collect in the future is more reflective of their students.

Have staff members been explicitly trained on procedures and policies for using the screener? In what ways does the team review the definitions, procedures, and policies with all staff members?

- In what ways does the team monitor whether staff members are following procedures?
- Did all staff members complete the universal screener?
- How well did you teach the scoring of the universal screener?
- Did all staff members complete the screener within the same time window?
- Is the data window realistic and achievable?

Using these questions to analyze incongruent data can assist teams in determining areas of administrative fidelity that need improvement. Once a team has completed these questions, the answers that were of concern need to transfer to an action and/or communication plan as steps to address data validity in the future.

Step 2: Analyze Data

Critical Components:

- Who: District leadership team, building/program leadership team, and possibly collaborative teams.
- What: Universal screening data at the district/program/classroom level.
- When: After each universal screening in the fall, winter, and spring.
- Why: To make district/program-level decisions regarding curriculum, intervention, instruction, assessment, and professional development.

After every universal screening period, leadership teams should set aside time to examine their data at the district/program/classroom levels to evaluate the current mathematical strengths and needs of their students and to inform decisions regarding the curriculum, intervention, instruction, assessment, and professional development needs of their program. For preschool programs, spring universal screening data provides the best estimate of how well your mathematics curriculum and interventions are meeting the needs of your students. However, as programs collect and compare universal screening data across years, they might see trends or

changes that also need to be addressed.

As leadership teams examine their math universal screening data, the questions below provide some areas for consideration.

- Were 80% or more of your students in the Tier 1 category for universal screening subtests in your prior year's spring data? If not, focus your efforts on increasing support at Tier 1.
- Are there fewer students in the Tier 2/3 categories in each subsequent data set?
- How has your data changed across the years?
- Are there more students in the Tier 1 categories in each subsequent data set?
- Are there differences across classrooms? Are there classroom differences that can account for the difference in classroom data?
- Does your program use an evidence-based early mathematics curriculum that addresses all of the Kansas Early Learning Standards?
- Does the teaching staff demonstrate intentional planning and teaching strategies that promote early mathematics learning during child-initiated play?
- Do all classrooms provide a math-rich environment that includes instructional materials and activities to promote counting and cardinality, operations and algebraic thinking, measurement and data, and geometry?
- Does the teaching staff use evidence-based instructional strategies to promote children's growth and development?
- Does the teaching staff provide opportunities for open-ended, child-initiated, indoor and outdoor play to promote children's growth and development?
- Is there an appropriate balance between teacher-directed and child-initiated activities related to early numeracy?
- Do all classrooms have a clear schedule and lesson plans that are connected to the curriculum?
- Are mathematical opportunities planned for the minimum number of minutes for your Tier 1 protocol?
- Do all preschool children, regardless of skill level, get an equitable amount of time for mathematical work?
- Are at least 80% to 90% of students engaged at least 80% to 90% of the time?

Preschool programs that serve primarily students considered at risk might find that less than 80% of their students are at benchmark in the fall. When universal screening data indicate that less than 80% of students are at Tier 1 during any screening period, leadership teams should develop a plan for implementing class-wide interventions. In making this decision, leadership teams reflect on the resources of their program (length of day, number of staff serving each classroom) and their program's capacity to provide child-specific interventions. A leadership team might decide that all mathematics interventions will be provided at the class level between the current and next universal screening periods, or they might consider both a class-level intervention and child-

specific interventions for the bottom quartile or a select group of students.

During Phase 1, your district/program selected evidence-based interventions for preschool mathematics that focus on the number core. When selecting class-wide interventions, leadership teams should also focus their efforts on selecting evidence-based interventions that emphasize the number core. A class-wide intervention is something all classes (or specific classes) will do *in addition to* your Tier 1 protocol requirements. For example, such an intervention could incorporate an additional small group per week for all students that focus specifically on counting and cardinality, a daily transition planned to incorporate number sense concepts, and/or a mathematics center focused on number sense with students required to participate for 10 minutes twice per week.

When a program is going to use class-wide interventions, they should be added to your Preschool Integrated Protocol. As at each of the previous steps, once decisions have been made and documented on your protocol, leadership teams should create a plan for communication/dissemination and consider the professional development needs of the staff members who will implement the selected class-wide intervention(s). Leadership teams must set clear expectations for how interventions should be implemented and used with fidelity and provide professional development to support such outcomes.

Step 3: Use Data to Group Students

Critical Components:

- Who: Collaborative teams.
- What: Universal screening data at the classroom/student level.
- When: After *every* universal screening in the fall, winter, and spring.
- Why: To make child-level instructional decisions regarding mathematics intervention.

The universal screening tool your program selected for mathematics, assesses children in the strand of counting and cardinality, which is predictive of later mathematics achievement. While this is not the only strand that should be taught as your Tier 1 curriculum, it should be the focus of your intervention efforts. Some universal screening tools provide a single composite score for early mathematics, while others provide a ranking for each subtest administered. Regardless of which tool your program uses, the goal for grouping students is to create a single group for intervention.

If your universal screening tool provides a composite score, collaborative teams will use the decision rules for that universal screening tool to identify which students might need Tier 2/3 intervention.

If your universal screening tool provides individual sub-test rankings, collaborative teams will determine intervention groups based on a cumulative ranking of each student's tier for each subtest. For example, if a student is at benchmark on 3 of 4 subtests, the collaborative team

might consider that students be at Tier 1 for this period. Similarly, if a student scores at Tier 2 on 3 subtests and Tier 3 on the 4th subtest, the collaborative team might determine that the student needs Tier 2 supports. Leadership teams can leave the final decision about which tier an individual student is in according to the teacher's knowledge of each student or decide to create some decision rules for making this determination. It is important that teams consider the specific universal screening tool and the most accurate interpretation of those scores.

As classroom teams begin to place students in intervention groups, they will want to group students with similar needs into the same group for intervention. Using the *Preschool Intervention Log* (Appendix), collaborative teams will create a list of intervention groups for mathematics within each classroom.

Step 4: Determine Focus of Intervention

Critical Components:

- Who: Collaborative teams.
- What: Universal screening data at the classroom/student level.
- When: After each universal screening in the fall, winter, and spring.
- Why: To make child-level instructional decisions regarding mathematics intervention.

Although it is primarily the responsibility of the building/program leadership team to determine the materials available on your Tier 2 and Tier 3 protocols, collaborative teams will be asked to choose between appropriate interventions available on these protocols. Once the protocol interventions have been selected, collaborative teams should finalize the *Preschool Intervention Log* and provide the summaries to the building/program leadership team. The building/program leadership team should then consider the following questions:

- Are students being matched to interventions correctly?
- Does the building have appropriate protocol interventions available to meet the needs of all of the students?
- Do interventionists have the training and materials needed to provide the comprehensive protocol instruction with fidelity?
- Are the comprehensive protocols being taught with fidelity?

It is important to remember that programs alone do not teach. The Kansas MTSS and Alignment uses a hybrid approach to intervention. Collaborative teams are asked to begin with the protocol interventions from the Tier 2/3 protocols and to keep progress monitoring data regarding the effectiveness of the intervention for each student. If a student is not making progress, collaborative teams will then move to a problem-solving process to ensure that each student is making progress toward their mathematical goals.

Step 5: Progress Monitoring

Critical Components:

- Who: Building/programs leadership teams and collaborative teams.
- What: Data regarding the progress students are making during intervention.
- When: For students receiving Tier 2 intervention, at least one time every other week.
For students receiving Tier 3 intervention, at least once a week.
- Why: To make child-level instructional decisions regarding mathematics intervention.

Progress monitoring is conducted within the Kansas MTSS and Alignment to inform educators of students' growth related to intervention content knowledge and skills. Regular progress monitoring and review of data "may reflect the effectiveness and efficiency of the core instruction" (Carta, Young, p.5, 2019).

For preschool students in the core (Tier 1), progress monitoring is often conducted using curriculum-based assessments (e.g., AEPS, Teaching Strategies Gold), administered three to four times per year. These assessments are tied to content-area instruction and help teachers determine whether students have learned the concepts and skills taught so that subsequent instruction can be adjusted to re-teach concepts or provide additional practice of skills not yet mastered.

For students receiving supplemental (Tier 2) and intensive (Tier 3) instruction, progress-monitoring data are used to chart the growth of individual students regarding the skills being targeted in intervention. Progress monitoring for students receiving supplemental or intensive instruction should address two questions:

1. Is the intervention working?
2. Does the effectiveness of the intervention warrant continued, increased, or decreased support?

Unlike the K-12 MTSS system, preschool universal screening tools generally cannot also be used as progress monitoring tools, because they cannot be given with enough frequency to monitor intervention effectiveness and make changes to the level of intervention a student receives. Instead, preschool programs are encouraged to use mastery monitoring strategies to assess and monitor the progress of students receiving tiered intervention. Mastery monitoring strategies are teacher designed and involve directly collecting data on a student's mastery of the specific skills being taught in intervention. Typically, changes to the level of tiered instruction a preschool student receives will only happen after each universal screening benchmark period; however, teachers can use the data they collect through mastery monitoring and their knowledge of the child to make changes when the intervention efforts do not seem to be effective or indicate that a change is needed.

Collecting and graphing progress-monitoring data over a series of weeks provides a visual pattern of skill acquisition for students receiving additional support. The Kansas MTSS and Alignment recommends that mastery monitoring data collection in preschool occur at least one time every two to three weeks for students receiving Tier 2 support and one time every one to

two weeks for students receiving Tier 3 support.

The building/program leadership team continues to have responsibility for conducting fidelity checks to ensure that collaborative teams are following the guidelines for collecting progress monitoring data and regular discussion by the collaborative team regarding students' progress.

Step 6: Document Interventions

Critical Components:

- Who: Building/programs leadership team and collaborative teams.
- What: Data regarding the progress students are making during intervention.
- When: For students receiving Tier 2/3 intervention daily.
- Why: To ensure that the MTSS system is working efficiently.

Maintaining documentation of interventions is a critical step for documenting implementation fidelity and should be the first place checked if students are not making progress. Additionally, an intervention log provides a record of any changes made to a student's Tier 2 or Tier 3 intervention. Your teams should follow decision rules and protocols created by your building/program leadership team to ensure that your MTSS consistently and efficiently meets the dynamic needs of your students.

Preschool Universal Screening Tools

Screener	Description	Target Group	Additional Information
Academic Screeners			
myIGDIs (Individual Growth & Development Indicators)	<ul style="list-style-type: none"> The myIGDIs early literacy+ includes measures for vocabulary, comprehension, phonological awareness and alphabet knowledge. An alternate Spanish version is available for literacy. Also available on the iPad. The myIGDIs early numeracy includes measures for numbers and operations. 	4 and 5 year olds	Pricing available at: http://www.myigdis.com
Preschool Early Literacy Indicators (PELI)	<ul style="list-style-type: none"> The PELI measures early literacy through a storybook format and includes measures for alphabet knowledge, vocabulary and oral language, phonological awareness, and listening comprehension. 	3 to 5 year olds	Pricing available at: https://acadiencelarning.org/acadienc-e-reading/prek-peli/ or email info@acadiencelarning.org
FastBridge	<ul style="list-style-type: none"> earlyReading composite measures alphabet knowledge and phonological awareness earlyMath composite includes measures for numbers and operations. 	4 and 5 year olds	Available from Illuminate Education. Those interested should contact FastBridge for pricing and availability http://www.fastbridge.org/assessments/
PALS-PreK	<ul style="list-style-type: none"> PALS-PreK includes 6 tasks which are: name writing, alphabet knowledge, beginning sound awareness, print and word awareness, rhyme awareness and nursery rhyme awareness. It does not include an oral language measure. 	4 to 5 year olds	Pricing is on a per student basis with online scoring available at an additional const. Pricing is available at https://palsresource.info/new-to-pals/

Behavior and Social Emotional Screeners

Early Screening Project:	<ul style="list-style-type: none"> The ESP is a screening tool that assesses the frequency and intensity of behavior problems in young children. There are three stages of assessment, ranging from teacher rankings and ratings to direct observations of behavior. 	Preschool	Free paper questionnaires (pen and paper) http://sdqinfo.org/py/sdqinfo/b3.py?language=Englishqz(USA) Online scoring (\$0.25 per SDQ scored) https://admin.sdqscore.org/ Online administration of SDQ requires license or fee sdq.scoring@gmail.com
Strengths and Difficulties Questionnaire	<ul style="list-style-type: none"> Use to assess students on five behavioral domains: conduct problems, hyperactivity, peer problems, emotional symptoms, and prosocial behavior 	3-16 year olds	https://www.sdqinfo.org/a0.html Free – Download online and score by hand (SDQ; Goodman, 1997) or access web-based administering and scoring for a nominal price
BASC-2 Behavioral and Emotional Screening System	<ul style="list-style-type: none"> Use to identify children who might be experiencing behavioral or emotional issues that negatively impact their academic achievement or social relationships. 	Preschool (starting at age 3) School-age through 12th grade	Pricing available at: www.pearsonassessments.com
Social Skills Improvement System: Performance Screening Guide (SSiS)	<ul style="list-style-type: none"> Use to gather information about students in four domains: prosocial behavior, motivation to learn, reading skills, and math skills. 	Age range: 3-18 years old	Pricing available at: https://www.pearsonassessments.com/store/usassessments/en/Store/Professional-Assessments/Behavior/Social-Skills-Improvement-System-Performance-Screening-Guide/p/100000356.html?tab=product-details
Student Risk Screening Scale- Early Childhood (SRSS-EC)	<ul style="list-style-type: none"> 11 items split across two subscales representing characteristics of externalizing and internalizing behaviors. 	Preschool	http://www.ci3t.org/screening#srssec Free
